In summary, the Imbert gasifier design has survived the test of time and mass production. It is relatively inexpensive, uses simple materials of construction, is easy to fabricate, and can be operated by motorists with a minimum of training. It supplies low-tar gas from highly volatile fuels with a high turndown ratio.

A proven design concept that works very well and is stable if it's set up correctly. The Imbert gasifier pros: The Imbert gasifier cons: The build is a bit more involved and technical. The guidelines must be met to match the Imbert to the engine it will be running to achieve the correct temperatures to crack the tars down into a useful part of the fuel. The gasifier as a whole will run hotter ...

Designing an "Imbert" type gasifier now boils down to estimating the maximum amount of gas needed. This is easily done by taking into account the cylinder volume and number of revolutions as well as the volumetric efficiency of an internal combustion engine coupled to the system (see section 2.1 and Appendix 1). From this gas amount as well as from the B maximum value (0.9) the area of the smallest constriction and the diameter of the throat can be calculated.
